The published study represents the first systematic review of diadynamic currents (DDCs) within the field of electrotherapy [1]. This research is expected to yield valuable insights into the significance of DDC in clinical contexts. To enhance the review, It is suggested to incorporate a statistical analysis that groups the studies in relation to the variable post-treatment pain intensity as the main outcome to determine the pooled effect.

A meta-analysis was conducted using data from the visual analogue scale (VAS) and numeric pain rating scale (NPRS), which are both standard pain assessment tools [2]. Given the substantial heterogeneity across the randomised controlled trials (RCTs), the Dersimonian-Laird random-effects method was applied [3]. Notably, most studies compared DDC with transcutaneous nerve stimulation (TENS) [1].

Figure 1 showed the meta-analysis with a pooled effect in terms of a mean difference of -0.83 cm (95% CI: -1.9,-0.2:

p=0.12) for visual analogue scale (VAS) and -0.78 points (95% CI: -1.2,-0.4: p<0.01) for the numeric pain rating score (NPRS), which was statistically significant only for NPRS. Furthermore, in both of Gomes et al.' study, the combination of DDC and manual therapy reduced pain by 53% [4], while in Dibai-Filho et al.'s study, this combination achieved a 49% decrease [5], which represents a clinically minimally important change (MCID) [6].

Even though some RCTs have shown that DDCs are better at reducing pain than TENS, the overall effect suggests that this is still not clear when comparing the two scales evaluated.

Hence, the evidence does not definitively establish DDCs as superior to TENS. This suggests that DDCs are a viable clinical alternative on par with TENS for musculoskeletal pain. The choice between these approaches may hinge on resource availability or the individual pain-modulating mechanism preferences.

Figure 1A. Pain intensity at rest (VAS)

	DDC			Control			Mean Difference		Mean Difference
Study or Subgroup	Mean [cm]	SD [cm]	Total	Mean [cm]	SD [cm]	Total	Weight	IV, Random, 95% CI	IV, Random, 95% CI
Urrutia et al.	3.3	2.9	15	6.6	2.8	15	11.4%	-3.30 [-5.34, -1.26]	
Anand et al.	4.3	2.4	15	6.9	1.5	15	14.6%	-2.60 [-4.03, -1.17]	
Can et al.	1.7	2.1	14	2.8	3.2	16	12.0%	-1.10 [-3.02, 0.82]	
Forogh et al.	4.2	1.9	15	4.5	1.9	15	15.0%	-0.30 [-1.66, 1.06]	
Tugay et al.	3.4	1.5	16	3.5	2.1	16	15.5%	-0.10 [-1.36, 1.16]	
Sayilir et al.	3.1	2.5	24	3.1	2.4	20	14.5%	0.00 [-1.45, 1.45]	
Ratajczak et al.	4.1	2.3	40	3.4	2.1	40	17.1%	0.70 [-0.27, 1.67]	 -
Total (95% CI)			139			137	100.0%	-0.83 [-1.87, 0.22]	•
Heterogeneity: Tau²			6 (P=	0.0009); I² = 7	4%			_	-4 -2 0 2 4
Test for overall effect: Z = 1.55 (P = 0.12)									Favours DDC Favours control

3	,	DC	Co	ontrol		Mean Difference		Mean Difference	
Study or Subgroup	Mean [score]	SD [score]	Total	Mean [score]	SD [score]	Total	Weight	IV, Fixed, 95% CI	IV, Fixed, 95% CI
Gomes et al.*	3.4	0.9	20	5.3	1.1	20	38.0%	-1.90 [-2.52, -1.28]	-
Dibai-Filho et al.**	1.56	0.9	20	1.9	1.8	20	18.9%	-0.34 [-1.22, 0.54]	
Gomes et al.*	5.1	1.4	20	5.3	1.1	20	24.2%	-0.20 [-0.98, 0.58]	-
Dibai-Filho et al.**	1.56	0.9	20	1.3	1.8	20	18.9%	0.26 [-0.62, 1.14]	+
Total (95% CI)			80			80	100.0%	-0.78 [-1.17, -0.40]	•
Heterogeneity: Chi ² =	20.84, df = 3 (P	= 0.0001); l2 =	86%						1 1 1 1
Test for overall effect: Z = 4.01 (P < 0.0001)									Favours DDC Favours control

^{*} The Gomes study underwent a dual analysis, comparing DDC with manual therapy and DDC plus manual therapy against isolated manual therapy.
